No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        US-10-081-817A-19

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                236
                                                                                                                                                                                                                                                                                                                                                                                                Sequence 196114/c

Sequence 196114, Application US/10027632

GENERAL INFORMATION:
APPLICANT: Wang, David G.
TITLE OF INVENTION: Identification and Mapping of Single Nucleotide
TITLE OF INVENTION: Polymorphisms in the Human Genome
FILE REFERENCE: 108827.129
CURRENT APPLICATION NUMBER: US/10/027,632
CURRENT FILING DATE: 2002-04-30
PRIOR APPLICATION NUMBER: US 60/218,006

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   nucleic search, using sw model

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequences shown in AAV54616 to AAV54621 represent LU105 specific CC polynucleotide sequences. These are used in the method of the invention CC for detecting target LU105 nucleic acid. The method comprises treating a CC sample with at least one LU105 specific nucleic acid, or its complement CC which is at least 50 percent identical with the LU105 specific nucleic acid sequences (AAV54616 to AAV54621). LU105 is a lung disease marker. CC cells transformed with a recombinant expression system that contains CC LU105 specific nucleic acid fragments, are used to express recombinant CC LU105 specific nucleic acid fragments, are used to express recombinant CC used to detect the LU105 antigen, and correspondingly this antigen is CC used to detect specific antibodies, in usual immunoassays The LU105 CC used to detect the LU105 antigen, and correspondingly this antigen of constituting, prognosis, prevention, treatment and determination of CC susceptibility to, lung disease, specifically cancer. The LU105 CC used to used to used to used to seed to series for lung disease (present at high CC concentration, in altered form or in an unusual body compartment). LU105 CC can be detected in blood, plasma or serum in an inexpensive, non-invasive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

CC human signal peptide-containing proteins HSPP-1 to HSPP-134. HSPPs have canticancer, anti-inflammatory, antimicrobial, nootropic, hepatotropic, canticancer, anti-inflammatory, antimicrobial, nootropic, hepatotropic, cassociated with decreased activity or function of HSPP. Antagonists of CC activity or function of HSPP. Such diseases include cell proliferation cativity or function of HSPP. Such diseases include cell proliferation comproductive or developmental disorders associated with increased cc irrhosis, psoriasis, acquired immune deficiency syndrome, anaemia, CC reproductive or developmental disorders, (e.g. arteriosclerosis, cc irrhosis, psoriasis, acquired immune deficiency syndrome, anaemia, CC asthma, Crohn's disease, microbial or other infections, congestive or clischaemic heart disease, Alzheimer's, parkinson's or Huntington's CC diseases, Schizophrenia, ovulatory defects, muscular dystrophy). HSPP CC nucleic acids can be used for the recombianant production of HSPP, for Cd detecting HSPP in standard hybridisation and amplification assays (for CC tiphex-forming or ribozyme therapeutics, for detecting related sequences CC or genetic variations, and for chromosomal mapping. HSPP are also used to craise specific antibodies (Ab) and to screen for agonists and antiponists, in competitive drug screens, and for purification of HSPP cromostrus, in competitive drug screens, and for purification of HSPP cromostrus, in competitive drug screens, and for purification of HSPP cromostrus, in competitive drug screens, and for purification of HSPP cromostrus, in competitive drug screens, and for purification of HSPP cromostrus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           26-JUN-1998;

                                  The present sequence is a lung specific gene (LSG) Lng107 from human clone ID 586271. The LSG has high level of tissue specificity for lungs and is overexpressed in cancerous tissues. The sequence serves as a diagnostic marker for detecting, monitoring, staging and prognosticating lung cancer. The diagnostis involves comparing levels of LSG in samples obtained from patient and normal control.
                                                                                                                                                                                                                                                                                                                                                                                                                                          AAZ29723 standard; DNA; 543

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    cc Sequences shown in AAV$4616 to AAV$4621 represent LU105 specific polynucleotide sequences. These are used in the method of the invention composition and the sequences of the invention composition and the sequences of the composition and the sequences that least one LU105 specific nucleic acid, or its complement complete with at least one LU105 specific nucleic acid, or its complement complete with its at least 50 percent identical with the LU105 specific nucleic acid sequences (AAV$4616 to AAV$4621). LU105 is a lung disease marker call transformed with a recombinant expression system that contains complete complete with a recombinant expression system that contains cullofs specific nucleic acid fragments, are used to express recombinant cullofs specific antibodies, in usual immunoassays. The antibodies are used to detect the LU105 antigen, and correspondingly this antigen is cused to detect specific antibodies, in usual immunoassays. The LU105 constitution, prognosis, prevention, treatment and determination of susceptibility to, lung disease, specifically cancer. The LU105 concentration, in altered form or in an unusual body compartment). LU105 can be detected in blood, plasma or serum in an inexpensive, non-invasive can be detected in blood, plasma or serum in an inexpensive, non-invasive.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Ashkenazi AJ,
Marsters SA,
Watanabe CK,
                                                                                                                                                                                                                                                                                                                       The present invention relates to the isolation of novel human PRO polypeptides and the polynucleotide sequences encoding them. The PRO polypeptides, agonists, antagonists or anti-PRO antibodies are useful for treating benign or malignant tumours (e.g. renal, kidney, bladder, breast, etc), leukaemias and lymphoid malignancies, other disorders such as neuronal, glial, astrocytal, hypothalamic, glandular, macrophagal, stromal and blastocoelic disorders, inflammatory, immune and angiogenic disorders. The polynucleotide sequences are also useful in gene therapy. ABK40254-ABK40288 encode for the human PRO polypeptides of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            11-FEB-2000;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Thirty five nucleic acids encoding PRO polypeptides, useful for treating benign or malignant tumours, leukaemias and lymphoid malignancies, inflammatory, angiogenic and immunologic disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                               Claim 50; Fig 27; 302pp; English

                                                                                                                                                                                                                                                                                                                  The invention provides membrane-bound PRO polypeptides and polynucleotides encoding them. The PRO sequences of the invention were identified based on extracellular domain homology screening. The PRO sequences have homology with proteins including IDL receptors, TIE ligands and various enzymes. The membrane-bound proteins and receptor molecules are useful as pharmaceutical and diagnostic agents. Receptor immunoadhesins, for instance, can be used as therapeutic agents to block receptor-ligand interactions. The membrane-bound proteins can also be employed for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interaction. The PRO encoding sequences are useful as hybridization probes, in chromosome and gene mapping and in the generation of antisense RNA and DNA. PRO nucleic acid sequences will also be useful for the preparation of PRO polypeptides, especially by recombinant techniques.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        WPI; 200

PRO polynucleotides used bioactive molecules such specific cells, to cause to produce polypeptides as toxins, radiolabels c targeted cell death or antibodies, ť

Claim 2; Fig 289; 935pp; English.

The present invention describes human secreted and transmembrane PRO proteins. The PRO proteins have cytostatic activity. The PRO proteins can be used for targeted delivery of bioactive molecules, such as toxins, radiolabels or antibodies, that cause cell death. PRO nucleotide sequences, and their fragments, can be used as hybridisation probes, in chromosomal and gene mapping, and in the generation of anti-sense RNA and DNA. They may also be used to produce transgenic animals which are used to develop and screen therapeutically useful reagents. The PRO

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            nucleotide and protein sequence can be used for tissue typing and in treating cancer. Anti-PRO antibodies can be used in diagnostic assays. AAF44270 to AAF44470 represent PCR primers and hybridisation probes us in the isolation of human PRO sequences. AAF44087 to AAF44269 and AAB65154 to AAB65300 represent human PRO polynucleotide and protein sequences given in the exemplification of the present invention.

Crimbellial growth factor (VEGF) stimulate proliferation of cells and setular and are thus and setular dependence of stimulate string endothelial cells, pro0186 and setulate and are thus cells and setulate are considered and therefore are useful for treating conditions or disorders where angiopeptide are thus cells and setulate are considered and the thus cells and is thus cells and pro1387 induce c-fos in endothelial growth, and pro336, cell pro1386 and pro1387 induce c-fos in endothelial growth, and pro1387 pro1386 are pro1386 or pro535, pro8150 and pro1387 induce c-fos in endothelial growth, and pro536, cells setul for treating conditions or disorders where angiopenesis would be beneficial, e.g. wound healing and antagonist of this polypeptide are cells and is thus useful for inhibiting endothelial cells, and are thus cells and is thus useful for inhibiting endothelial cell growth in cells and is thus useful for inhibiting endothelial cell growth. Pro826, pro1068, pro1184, pro1346 and pro1375 stimulated proliferation of endothelial cell growth in cells in inhibiting tumour growth. Pro826, cells and in the profile are profileration of cells in inhibiting endothelial cell growth in pro826, cells inhibiting endothelial cell growth in pro1368 or pro1368, pro1328, pro132

New transmembrane polypeptides and nucleic acids encoding the polypeptides, useful in gene therapy, in chromosome identification, chromosome markers, or in generating probes as

Claim Fig 289; 650pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides CC comprising a sequence without signal peptide and the nucleic acid cencoding them. The polypeptides can be used to raise antibodies that CC encoding them. The polypeptides can be used to raise antibodies that CC specifically bind to the PRO polypeptide, for linking a bloactive CC molecule to a cell expressing a PRO protein and for modulating at least CC one biological activity of a cell. The PRO polypeptides or polynucleotides are also useful in gene therapy, in chromosome CC identification, as chromosome markers, or in generating probes. The PRO polypeptides are useful as molecular markers for protein CC electrophoresis, and the isolated nucleic acids may be used for cecombinantly expressing those markers. The PRO polypeptides are useful in diagnostic assays for PRO, and in affinity purification of PRO from CC acids may also be used in tissue typing. Anti-PRO antibodies are useful in diagnostic assays for PRO, and in affinity purification of PRO from CC acids may also be used in tissue typing. Anti-PRO antibodies are useful in diagnostic assays for PRO, and in affinity purification of PRO from CC acids may also are the genes encoding, the primers amplifying and the CC probes detecting the PRO polypucleotides of the invention.

CC PROSE THE SEQUENCE OF THE SEQUENCE OF THE SEQUENCE DATA SECUENCE. The sequence at a sequence of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CC omprising a sequence without signal peptide and the nucleic acid ce encoding them. The polypeptides can be used to raise antibodies that CC specifically bind to the PRO polypeptide, for linking a bioactive conclude to a cell expressing a PRO protein and for modulating at least CC one biological activity of a cell. The PRO polypeptides or polynucleotides are also useful as pharmaceuticals, diagnostics, CC polynucleotides are also useful as pharmaceuticals, diagnostics, CC polynucleotides are also useful as pharmaceuticals, diagnostics or bioseancors or bioreactors, for detecting or treating e.g. tumours in CC mammals, e.g. humans, dogs, cats, cattle, horses, sheep, pigs, goats or CC rabbits as targets for therapeutic intervention in certain cancers (e.g. CC colon, lung or breast cancers) and diagnostic determination of the CC presence of these cancers. The PRO polypeptides are also useful as molecular weight markers or for chromosome identification. The PRO genes CC CDNA, genomic DNA or mRNA. The PRO genes may also be used in gene CC therapy, particularly for replacing a defective gene. The sequences CC amplifying and the probes detecting the PRO polynucleotides of the CC invention.

CC Note: The sequence data for this patent is also available in electronic CC format from USPTO at sequence. html.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            protein; transmembrane protein;
immunosuppressive; transgenic;
        The present invention relates to the isolation of novel human PRO CC polypeptides, and the polynucleotide sequences encoding them. The CC propertides are useful for detecting other propertides. The PRO CC linking bioactive molecules to cells expressing PRO polypeptides, for CC linking bioactive molecules to cells expressing PRO polypeptides, for CC polypeptides, and for for identifying agonists or antagonists. The propertides are useful as CC polypeptides, and for for identifying agonists or antagonists. The propertides are useful as CC polypeptides, and for the propertides are useful as CC polypeptides, and for the propertide and gene mapping, in the generation CC of antisense RNA and DNA, in the preparation of PRO polypeptides, for CC polypeptide, and for the genetic analysis of individuals with genetic CC polypeptide, and for mapping the gene which encodes the PRO CC golypeptide, and for the genetic analysis of individuals with genetic CC disorders, in gene therapy, for chromosome identification, as CC chromosome markers, and for generating probes for PCR, Northern CC sequence encodes a human PRO polypeptide of the invention. CC sequence encodes a human PRO polypeptide of the invention. CC format directly from the USPTO web site at CC sequence data for this patent was obtained in electronic CC sequence data for this patent was obtained in electronic CC sequence and properties and properties at the sequence data for this patent was obtained in electronic CC sequence data for this patent was obtained in electronic CC sequence data for this patent was obtained in electronic CC sequence data for this patent was obtained in electronic CC sequence data for this patent was obtained in electronic CC sequence data for this patent was obtained in electronic CC sequence data for this patent was obtained in electronic CC sequence data for this patent was obtained in electronic CC sequence data for this patent was obtained in electronic CC sequence data for this patent was obtained in electronic CC content of the content

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a secreted and transmembrane polypeptide, termed CC PRO polypeptide, and the polypeptides encoding it. The polypeptide is CC useful for detecting, PRO polypeptides and for linking a bloactive considered to a cell expressing the above polypeptides, where the bloactive molecule is a toxin, radiolabel or an antibody. The bloactive material CC causes the death of the cell. The polypeptide is useful for identifying CC agonists or antagonists of the PRO polypeptide is useful for preparing variants of PRO, as a molecular weight marker for protein electrophoresis purposes can the PRO polynuclectide is useful for recombinantly expressing those conclusions and gene mapping, in generation of antisense RNA and DNA, in the preparation of PRO polypeptide, for generating transgenic animals or knockout animals which in turn are useful in the development and CC knockout animals which in turn are useful in the development and CC screening of the gene which encodes PRO and for the genetic canalysis of individuals with genetic disorders, in gene therapy, for probes for mapping the gene which encodes PRO and for the genetating canalysis of individuals with genetic disorders, in gene therapy, for probes for pck, Northern analysis, Southern analysis and Western consumed the probability of the probabil
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

Sequence 4736, Application US/09770175

GENERAL INFORMATION:
APPLICANT: HOILZMAN, David P.
APPLICANT: HOILZMAN, DOUGLAS A.
TITLE OF INVENTION: NOVEL NUCLEIC ACID MOLECULES AND USES
TITLE OF INVENTION: THEREOR
FILE REFERENCE: 1600.2058-001
CURRENT APPLICATION UNMBER: US/09/770,175
CURRENT APPLICATION NUMBER: US 60/178,874
PRIOR APPLICATION NUMBER: US 60/178,874
PRIOR FILING DATE: 2000-01-28
NUMBER OF SEQ ID NOS: 8967
SOFTWARE: FASTSEQ for Windows Version 4.0
SEQ ID NO 4736
LENGTH: 624
TYPE: DNA
ORGANISM: Homo sapiens
FEATURE:
NAME/KEY: misc_feature
LOCATION: (1)...(624)
OTHER INFORMATION: n = A,T,C or G
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 RENERAL INFORMATION:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 length: 0

GENERAL INFORMATION:
GENERAL INFORMATION:
HICKORIAN HICKORY IN NUCLEIC ACID MOLECULES
TITLE OF INVENTION: DELYMORPHISMS IN NUCLEIC ACID MOLECULES
TITLE OF INVENTION: DELYMORPHISMS IN NUCLEIC ACID MOLECULES
TITLE OF INVENTION:
TITLE OF INVENTION: USES THEREOF
FILE REFERENCE: CL001480
CURRENT APPLICATION UMBER: US/60/495,114
CURRENT FLING DATE: 2003-08-15
NUMBER OF SEQ ID NOS: 91238
SOUTHWARD: FastSEQ for Windows Version 4.0
SEQ ID NO 16806
LENGTH: 27991
TYPE: DNA
ORGANISM: Homo sapiens
FEATURE:
RAME/KEY: misc_feature
LOCATION: (1)...(27991)
COTHER INFORMATION: n = A,T,C or G, or insertion/deletion polymorphism (see Tables 1-
OTHER INFORMATION: n = A,T,C or G, or insertion/deletion polymorphism
